Stainless Steel Diaphragm Valves for Aseptic and Sterile Applications
Leading the world in pharmaceutical and biotechnology industry sterilisation processes

GEMÜ is one of the leading manufacturers of valves, measurement and control systems for sterile applications in the pharmaceutical and biotechnology industries. This position is based on GEMÜ’s comprehensive investments in application-oriented research & development, amounting to more than 5% of the company’s turnover. The versatile product range is supplemented with a wide range of advisory services provided by industry specialists and application experts.

Customized solutions for your project business

GEMÜ provides the optimal solution from a single source. As a system supplier of isolation, actuator and control technology, we can respond very flexibly to your individual project-specific needs.

Our worldwide sales network provides fast reaction times, customer oriented service and a committed project management team.

Sterile valves in stainless steel

The purity and quality of our food and medicines have improved tremendously over recent years. In addition to the stricter regulations and approval conditions, GEMÜ has made an important contribution to these developments, too.

Our diaphragm valves find just as much use in yoghurt or toothpaste manufacture as in eye ointment, insulin or monoclonal antibodies production.

Ultra pure media for the semiconductor and microelectronics industries use aseptic stainless steel valves as well as, for example, fine chemicals. Depending on the version selected, the valves are suitable for ultra pure water (WFI), ultra high purity chemicals and intermediate or final products in the pharmaceutical, biotechnology and foodstuffs processing industries. The valve technical design makes them sterilisable and autoclavable. By virtue of being retrofitted with optionally available automation components, GEMÜ diaphragm valves can also perform control tasks.

Alongside standard components, GEMÜ additionally offers a variety of customized solutions, such as tank valves, valves for sterile sampling or multi-port valve blocks.

State-of-the-art factory equipment and machinery plus a motivated team ensure the best service. A worldwide network of distributors and an internal sales and logistics network guarantee that products and services reach you quickly and directly. GEMÜ continuously invests in product optimization and new product developments. Continuous dialogue with customers from a wide variety of industrial sectors is one of the factors in developing ideas for application-specific solutions of all types.

Health-essential cleanliness
T valve bodies made from block material

Description of use

T valve bodies are preferably welded into ring mains with the outlet in a vertical direction. This allows the working medium to be drawn off or fed almost deadleg free.

Features

- Tried and tested GEMÜ seal system
- Made from block material, no welds in the media wetted area (reduction of validation times)
- Compact design, GMP-compliant design
- Grades of surface finish: Internal contour mechanically polished and/or electropolished down to Ra 0.25 μm
- Standard valve body material 1.4435 (316L), other materials on request
- Fitted with butt weld spigots as standard; clamps, union ends and flanges on request
- Available with manual, pneumatic or motorized operators

T valve bodies for sampling, body version „A“

This particular design is used to take samples from large ring mains (≥ DN 50). A very good deadleg ratio is achieved as a result of the optimized contour. In comparison to the ring main cross section, the outlet branch has a small nominal size (≤ DN 15) and is provided with a diaphragm valve with a diaphragm size of 8 or 10.

Features

- Cavity fully shaped, deadleg ratio < 1 x D
- Compact design
- Optimal draining if installed at an angle
As a recognised diaphragm valve specialist, GEMÜ are familiar with almost all industrial sectors and applications. We are the leading supplier of stainless steel valves for aseptic and sterile applications in the pharmaceutical industry, biotechnology industry, as well as the foodstuff and beverage industries. As well as this, our valves also stand for reliability and a high standard of quality in the chemical and processing industries. The diaphragm, a central sealing element in the piping system is of major importance. Only the diaphragm and the valve body are in contact with the medium. At the same time, they also guarantee external hermetic sealing of the pipeline.

The system is more than the sum of the individual parts
The outstanding characteristics of the diaphragm valve are the result of the perfect interaction of tuned components. These are the valve body, the shut-off diaphragm, the diaphragm fixing, the compressor as well as the actuator. Our many years of experience and intensive dialogue with plant operators has enabled us to continue optimising the diaphragm valve design and its individual components.

Diaphragm and valve body are „inseparable“
GEMÜ valve bodies have a raised circular sealing bead on the inside diameter, in contrast to the valve bodies of other manufacturers. This results in a defined sealing edge. This measure reduces the ring-shaped gap between diaphragm and valve body in the external sealing area. This special feature makes GEMÜ diaphragm valves suitable for sterile applications. We also consider this crucial design and functional characteristic, which was developed by GEMÜ more than three decades ago and constantly refined, during the development of our diaphragms. Only this ensures that our customers can rely on the valve as a complete unit.

GEMÜ diaphragms have been developed, tested, and approved for applications with GEMÜ valve bodies. Therefore GEMÜ do not recommend or guarantee the use of other manufacturers diaphragms with GEMÜ valve bodies. We shall not accept any liability resulting from the use of diaphragms of other manufacturers inside GEMÜ diaphragm valves.
**Flexible diaphragm fixing**

The diaphragm is uniformly fixed in the compressor by means of a threaded pin. The only exception is the smallest diaphragm size (diaphragm size 8), which is pushed in with a rubber pin. The uniform fixing method applies both to soft elastomer and PTFE diaphragms. The largest advantage of fixing by means of a threaded pin, e.g. in comparison to a bayonet fitting, is the even transfer of forces onto the large area of the flanks of the screw thread. This prevents damage to the mechanical connection between compressor and diaphragm especially under vacuum operating conditions.

The uniform fixing of elastomer and PTFE diaphragms enables subsequent replacement of the diaphragm while using the same actuator.
Soft elastomer diaphragms

Soft elastomer diaphragms consist of EPDM rubber mixtures, which are peroxidically cross-linked (vulcanised) with each other. This enables the diaphragms to be used safely, even at high media temperatures. The diaphragms are provided with different technical features dependent on the mixture used and on the processing conditions such as the duration of the cross-linking process, the vulcanisation temperature as well as the vulcanisation pressure. The following statement applies in principle to soft elastomer materials: the higher the temperature load capability, the lower the service life is in relationship to the mechanical stress. Therefore both the temperature load and the deformability of diaphragms must be optimally adjusted to the application. Different constructional designs are available to achieve this. Soft elastomer diaphragms are characterised by a high insensitivity in the case of mechanically contaminated working media, e.g. cellular lumps, solid matter or catalytic solid matter. Slurries usually do not affect the function of the valve or the seal on the valve weir. Different EPDM rubber mixtures can be selected according to the operating/sterilisation temperatures and the chemical characteristics or the working media.

PTFE diaphragms-Membranen

The GEMÜ PTFE diaphragms are made of a chemically modified second-generation PTFE (TFMTM+) and provide maximum chemical resistance. Even under steam conditions, PTFE diaphragms wear much more slowly than soft elastomer diaphragms. In the case of highly permeating media the structure of PTFE materials requires appropriately larger bonding thicknesses, stiffening this diaphragm version compared to pure soft elastomer diaphragms. Due to the higher rigidity the service life of the diaphragm may be reduced on high cycle duties depending on the application.
Diaphragm expertise

Manufacture and documentation

GEMÜ leaves nothing to chance in the development and manufacture of diaphragms. As well as many years of experience in the field of diaphragm valves, GEMÜ can draw on the group’s ever increasing expertise in the field of diaphragm production. In addition to developing compounds, this also includes producing and permanent controlling the diaphragms during the manufacturing process. Random sampling of the finished products completes the comprehensive test cycle.

GEMÜ ensures its usual diaphragm quality thanks to the following measures:

• Raw materials are sourced exclusively from selected suppliers
• Comprehensive testing of the raw materials in our in-house laboratory or in external, accredited institutions
• Storage of raw materials under controlled conditions
• Automated testing and documentation processes during production
• State-of-the-art production facilities
• The diaphragms are tested on our own test rigs (includes special test cycles for the pharmaceutical industry)
## GEMÜ diaphragms

</tbody>
</table>

¹ The sterilisation temperature is valid for steam (saturated steam) or superheated water.
² If the sterilisation temperatures listed above are applied to the EPDM diaphragms for longer periods of time, the service life of the diaphragms will be reduced. In these cases, maintenance cycles must be adapted accordingly. This also applies to PTFE diaphragms exposed to high temperature fluctuations.

PTFE diaphragms can also be used as moisture barriers; however, this will reduce their service life. The maintenance cycles must be adapted accordingly.

GEMÜ 555 and 505 globe valves are particularly suitable for use in the area of steam generation and distribution. The following valve arrangement for interfaces between steam pipes and process pipes has proven itself over time:

A globe valve for shutting off steam pipes and a diaphragm valve as an interface to the process pipes.

Each application must be analysed before the selection of the diaphragm material. Since the most varied operating conditions often prevail within a plant at different locations, it can be necessary to use different valves and materials. In particular, the chemical characteristics and the temperature of the working media often lead to different interactions. The suitability of the materials used must therefore always be examined individually with regard to the current resistance list or checked by an authorised specialist. Only this procedure guarantees that the application will operate safely and economically for a longer period.

Diaphragms are wearing parts. They need to be regularly inspected and replaced otherwise malfunctions can occur, possibly resulting in hazardous situations. Please note: The maintenance intervals for inspecting and replacing diaphragms are application-dependent. In order to determine a suitable maintenance interval, the maintenance history and the stresses placed on the parts due to frequent sterilisation or frequent cycle duties must be taken into account.

### Note

Since plastics and elastomers are subject to natural aging, we recommend observing the GEMÜ storage conditions for shut-off diaphragms. You thereby guarantee maximum storage and service life of the diaphragms. The temperatures specified above are merely the permissible temperature ranges for the respective diaphragm. The permissible temperature ranges of the valve must always be taken into account for the overall valve design. These can be found in the respective datasheets.

The temperature values are indicated irrespective of operating pressure and diaphragm size and apply to water and/or inert gases. When using water vapour or saturated steam, observe the steam pressure diagram.

* Diaphragm size 8
The thread of the diaphragm pin „W“ corresponds to Whitworth standard.
Certificates and approvals

There is no universal diaphragm for all applications, hence we use different rubber mixtures and materials for our diaphragms. The different diaphragms have been certified according to their main fields of application so that we can certify conformity with the international regulations and rules below.

FDA (U.S. Food and Drug Administration)
FDA Extraction according to 21CFR 177.2600 for elastomers and 21CFR 177.1550 for PTFE.

USP (United States Pharmacopeia)
An independent institution has tested our diaphragms according to the regulations of the USP Class VI Chapter 87 In-Vitro and Chapter 88 In-Vivo. Furthermore, our diaphragms are free from animal ingredients.

RoHS
GEMÜ diaphragms comply with the RoHS Directive 2011/65 EC and the WEEE Directive 2002/96 EC.

Pressure Equipment Directive
As all diaphragm valves are pressure bearing components and as the diaphragm is the central sealing element in addition to the valve body, all diaphragms also comply with the European Pressure Equipment Directive 2014/68/EU Art. 3 § 3. If no original GEMÜ shut-off diaphragms are installed, GEMÜ cannot accept any responsibility.

EAC
Certification of conformity with the standards, quality and safety standards of the customs union between Russia, Kazakhstan, Belarus, Armenia and Kyrgyzstan.

EHEDG
Hygiene standards in the foodstuff and beverage industry are continuously increasing and are approaching those of the pharmaceutical industry in sensitive areas. For this reason, the EHEDG was established some years ago (European Hygienic Engineering and Design Group). GEMÜ was the first diaphragm valve manufacturer worldwide to be granted certification for its diaphragm valve system. The examination took place in 2002.
Management systems

GEMÜ is certified according to quality standard DIN EN ISO 9001:2008. This does not only apply to the German sites in Ingelfingen-Criesbach, Niedernhall-Waldzimmern and Kupferzell but also to our plant in Switzerland and the diaphragm manufacturing site in France. All German plants are also certified to the international environmental standard DIN EN ISO 14001:2004.

All valves and diaphragms are intensively tested on our own test rigs under realistic conditions. They are subjected to several static and dynamic tests because the service life of diaphragms depends on numerous interactions. To this end, there is a wide range of testing devices available, such as a state-of-the-art steam and a CIP/SIP* test rig.

Statistical tests are generally used to test external leak tightness and leak tightness across the weir. These involve checking the leak tightness at the maximum operating pressure and determining the operating pressure at which the first leaks occur. Dynamic tests are continuous stress tests where the limit values are determined depending on the diaphragm material and diaphragm size. The operating pressure for diaphragm valves, which we permit and recommend, is considerably less than the pressure at which the valves start leaking. This means additional safety for your plant. Our shut-off diaphragms sometimes achieve several million switching cycles depending upon application, material, and diaphragm size.

Depending on diaphragm type and material, dynamic vacuum tests (70 mbar absolute) are additionally carried out at ambient pressure. After the diaphragms have passed these internal tests without problems, field tests are carried out at selected customers. The diaphragms are only released for final series production and worldwide marketing after these fields tests have been completed successfully.

All compounding for GEMÜ shut-off diaphragms are carried out exclusively for and according to the specifications of GEMÜ. Production is likewise carried out according to strict quality criteria within the GEMÜ Group or at selected partners with whom we have a close partnership spanning many years.

Connection
Butt weld spigots, threaded connections, clamp connections. Different standards and designs available

Control function
Normally closed (NC)

Valve body material
1.4435, 1.4539 (optional) Different standards and designs available

Media temperature *
-10 to 100 °C

Operating pressure **
0 to 10 bar

Diaphragm material
EPDM, PTFE/EPDM

* dependent on diaphragm material; ** depending on version and/or operating parameters
GEMÜ 660

Diaphragm valve, pneumatically operated

Features

• Suitable for inert, corrosive, liquid and gaseous media
• Valve bodies and diaphragms available in various materials and designs
• Compact design for tight spaces
• Various connections available
• CIP/SIP capable
• Versions according to ATEX on request
• Specially optimized for dosing and filling applications

Operator
Stainless steel piston actuator, electropolished, with optical position indicator and integrated stroke limiter/seal adjuster

Nominal size
DN 4 to 25 (diaphragm size MG 8 to 25)

Body configuration
2/2-way body, T body, multi-port body, tank valve body

Connection
Butt weld spigots, threaded connections, clamp connections. Different standards and designs available

Control function
Normally closed (NC), Normally open (NO), Double acting (DA)

Valve body material
1.4435, 1.4539 (optional) Different standards and designs available

Media temperature *
-10 to 100 °C

Operating pressure **
0 to 5 bar

Diaphragm material
EPDM, PTFE/EPDM

* dependent on diaphragm material; ** depending on version and/or operating parameters
Single-use technology is becoming increasingly important, as it helps avoid cross-contamination risks and simplifies plant design. Secondary processes once required for cleaning and sterilizing (CIP/SIP) are virtually no longer necessary at all in single-use systems and processes. The necessary purity is guaranteed through the sterilisation by gamma rays of all the process components used.

The key difference in comparison to the conventional stainless steel plant design primarily lies in the lower initial investment costs and faster availability of the components for single-use systems. These advantages really come to the fore when working with small batch sizes, such as those typically required when developing new active substances in pilot systems. Although systems can be automated to some extent with the valve designs used to date in the single-use sector, their control accuracy is very limited. In addition, the process for documenting and validating the processes is rather complex. With GEMÜ SUMONDO®, the customer is now able to manufacture their products in an even simpler and safer manner. This makes pharmaceutical processes in the development of active substances reproducible, documentable and, as a result of the higher level of automation, less susceptible to faults.

Due to an innovative new diaphragm bonding technology, it is now possible to use an actuator unit and thus a control module that have been tried and tested in the field of conventional plant engineering for single-use processes. As is also the case with internal welded diaphragms, the valve body comes with extensive approvals, such as those required in the pharmaceutical and medical industries.

Currently, three valve body versions are offered in the nominal sizes from ¼” to 1” with a hose barb or with a clamp connection. These are implemented in the form of through flow, T and angle valve bodies.

The GEMÜ single-use diaphragm valve SUMONDO® comprises a pneumatic actuator and a distance piece with a mounting plate made of stainless steel, as well as a valve body made of plastic. It is equipped with an internally welded diaphragm, it is gamma-sterilizable and is manufactured in the cleanroom under controlled conditions. During assembly, a pin located on the diaphragm of the single-use diaphragm valve body is introduced into the compressor of the pneumatic actuator and locked in place using an indexing plunger. After use, the valve body and its diaphragm can be removed from the actuator and disposed of. The actuator and mounting plate can be used multiple times and remain in the plant.
Positioners and process controllers

Overview

GEMÜ pneumatic actuators can usually be paired with our electro-pneumatic positioners and process controllers.

In addition to the process parameters and the control system for which a positioner must be suitable, other technical functions and properties also play an important part in the selection of the right positioner.

To make your choice easier, we have placed the four GEMÜ positioners in a comparison based on important features.

1. Speed refers to the speed of the actuator from one end to the other.
Combi switchboxes and electrical position indicators for pneumatically operated linear valves

Our devices detect the valve stroke in any installation position without play and are tension-free. The sensor base of the GEMÜ 1234, 1235 and 4242 series is positively connected to the valve spindle by means of a preloaded spring so that possible tangential forces of the valve actuator do not negatively affect the position indicator. The position indicators can be quickly and easily assembled and are safe and uncomplicated to handle.

They can be adapted to pneumatic actuators of GEMÜ globe and diaphragm valves. Due to its special design, the GEMÜ 9415 quarter turn actuator may likewise be combined with this type of position indicator.

Grades of surface finish
2/2-way valve bodies

Modern, ergonomically shaped workstations and trained polishing staff give us the ability to provide high quality surface finishes. Depending on the required application, surface finishes from Ra 0.8 μm down to 0.25 μm can be achieved by polishing, electro polishing or a special process, we call "elysieren".

Mechanical hand polishing is carried out at our works to ensure our high quality standard.

Butt weld spigot bodies

In addition to the ISO butt weld spigots, the ASME BPE butt weld spigots are also standard connections in the GEMÜ aseptic valve range. Furthermore, other common standard butt weld spigots, such as DIN series 0, DIN 11850 series 1 to 3, BS-OD tubing, JIS and SMS 3008, are also available as standard.

The lengths of our butt weld spigot bodies are designed to provide the optimum for automatic orbital welding.

The butt weld spigot lengths guarantee trouble-free mounting and welding in an orbital welding machine using the collets and welding heads commonly used in the Biopharm industry. We recommend using this welding process to achieve the best possible weld quality and the process should be carried out by suitably qualified and certified welders.

Clamp bodies

All clamp connections are machined according to the spigot dimensions e.g. to DIN 11850, SMS 3008 or ASME BPE. We ask our customers to state which version or standard the connections shall comply with.

Depending on the version, clamps are machined from the solid forged body or welded on. Investment cast bodies have welded on clamps as standard.

Welding is carried out by specially qualified and certified welders utilising state-of-the-art welding technology. In principle, special connections requested by customers can be provided on GEMÜ butt weld spigot bodies. Thus it is also possible to have different connections on one body.

Clamp connections for forged 2/2-way bodies

Optimum draining angle see brochure "2/2-Way and T Valve Bodies in Stainless Steel"
Aseptic clamps

Aseptic clamping connections to DIN 11864-3-A complement the existing clamping connection options. Either grooved clamps or notched clamps are welded onto the base of the DIN or ISO butt weld spigot body on both sides. If the valve is to have a grooved clamp on one side and a notched clamp on the other side, this is defined by the corresponding code. Other types of connection, such as the combination of an aseptic clamp and butt weld spigot, are possible in principle and are each individually defined depending on requirements.

<tr>
<td>One side grooved aseptic clamp, other side notched aseptic clamp</td>
<td>E3 E6</td>
</tr>
</tbody>
</table>
Dairy pipe and aseptic unions

The dairy pipe union to DIN 11851 and the aseptic pipe union to DIN 11864-1-A are also standard connections. If the valve is to have a threaded spigot at one connection and a conical coupling or liner with union nuts at the other side, this is defined by the corresponding code. Furthermore, other versions customary on the market can also be adapted.

### Unions to DIN 11851

</tbody>
</table>
Aseptic flanges to DIN 11864-2 complement the existing standard connection options. Either grooved flanges on both sides or loose flanges are welded onto the base of the DIN or ISO butt weld spigot body. If the valve is to have a grooved flange at one connection and a loose flange at the other side, this is defined by the corresponding code. Other connections, such as the combination of an aseptic flange and butt weld spigot, are possible in principle and are each individually defined depending on requirements.

Kv value

In order to be able to compare the extremely varied geometries, valve designs and nominal sizes of different equipment and valves, they are always tested and measured under the same conditions. As a result of test conditions such as these, a flow rate that is specific to each valve is obtained and this flow rate can also serve as a calculation basis for planning a plant, for example.

The Kvs values stated below are only valid for 2/2-way valves.

Kvs value

The KVS value is the KV value when the valve is fully open (100%). The KVS value (nominal flow coefficient) corresponds to the KV100 value with a tolerance of ±10% (to DIN EN 60534).

Medium: Water (H₂O)
Temperature: 5 to 30 °C
Flow rate: The differential pressure ∆p between the pressure input and pressure output side is 1 bar.
Measurement unit: measured in m³/h

Cv value: measured in US gallons per minute, at a differential pressure ∆p of 1 PSI with water.

\[ 1 \text{ Cv} = 1,17 \times \text{Kv} \]
\[ 1 \text{ Kv} = 0,86 \times \text{Cv} \]

Notes:
For BS 4825 (Code 55) the Kvs values are the same or slightly higher than ASME BPE as the pipe internal diameters are almost identical. For JIS-G 3459 (Code 36) the Kvs values are the same or slightly lower than EN ISO 1127 as the pipe internal diameters are almost identical. Kvs values for clamp connections always refer to the corresponding pipe standard. Kvs values were determined with water at 20°C, P₁ = 6bar, P₂ = 5bar, EPDM Code 13 diaphragm, tolerance ± 10%.
Kvs values for PTFE diaphragms may be lower especially at lower operating pressures as the material is stiffer.
The operating pressure influences the Kv value.

GEMÜ has developed a patented angle gauge to simplify mounting 2/2-way stainless steel diaphragm valve bodies. The angle gauge enables quick and simple determination of the correct mounting position of a diaphragm valve body. The angle gauge is placed on the valve body so that its location spigots engage in the holes intended for actuator fixing. It is then locked by an eccentric cam at one of the location spigots. The flow direction is clearly identified to prevent incorrect positioning. The correct installation angle, dependent on the valve body type, is indicated in the brochure „2/2-Way and T Valve Bodies in Stainless Steel“.

The angle gauge is available for diaphragm sizes MG 8 to 100.

Please use the article numbers listed below when ordering:
